

## Model 150 Polymer Preparation System

After fifteen years of service the dry polymer batching system for our sludge dewatering presses was badly corroded and repair parts were becoming increasingly tough to find. We didn't need a whole new system as our batch tanks and mixers were still fine. The old machine simply needed a new heart and brain.

Clearwater Industries, unknown to us before bid time, came with some great recommendations from satisfied customers whose applications were similar to, if not more challenging than, our own. What's more, Clearwater was ready, willing and importantly able to tailor their system to meet our requirements and within our timeframe.

The new wetting system and batching control electronics they provided in all corrosion resistant materials was a perfect match for our needs. The equipment skid arrived on schedule and was quickly moved into place for connection by our staff. Startup was a breeze and the system has been running flawlessly since. The system not only accurately and reliably meets today's dosage requirements, but can be readily adjusted to meet those anticipated well into our future.

A Clearwater representative calls from time to time to follow up on the systems performance and make sure we are satisfied. That certainly has been the case. From design to post startup assistance, Clearwater Industries has provided us real value with custom built, rugged and easily maintained equipment.
